Cuadro 1: Simply typed lambda-calculus with Let binding, Records and General recursion.

LEMMA [Inversion of the Typing Relation]:

1. If $\Gamma \vdash x : R$, then $x : R \in \Gamma$
2. If $\Gamma \vdash \lambda x : T_1.t_2 : R$, then $R = T_1 \rightarrow R_2$ for some R_2 , with $\Gamma, x : T_1 \vdash t_2 : R_2$.
3. If $\Gamma \vdash t_1 t_2 : R$, then there is some type T_{11} such that $\Gamma \vdash t_1 : T_{11} \rightarrow R$ and $\Gamma \vdash t_2 : T_{11}$.
4. If $\Gamma \vdash \text{let } x = t_1 \text{ in } t_2 : R$, then there is some type T_1 such that $\Gamma \vdash t_1 : T_1$, with $\Gamma, x : T_1 \vdash t_2 : R$.
5. If $\Gamma \vdash \{l_i = t_i^{i \in 1 \dots n}\} : R$, then there are some types $R_i^{i \in 1 \dots n}$ such that for each i is satisfied that $\Gamma \vdash t_i : R_i$ and $R = \{l_i = R_i^{i \in 1 \dots n}\}$.
6. If $\Gamma \vdash t.l_j : R$, then there is some type $\{l_i = R_i^{i \in 1 \dots n}\}$ such that $\Gamma \vdash t : \{l_i = R_i^{i \in 1 \dots n}\}$ and $R = R_j$.
7. $\Gamma \vdash \text{fix } t_1 : R$ then $\Gamma \vdash t_1 : R \rightarrow R$.

Proof : Immediate from the definition of the typing relation.

LEMMA [Canonical Forms]:

1. If v is a value of type $T_1 \rightarrow T_2$, then $v = \lambda x : T_1.t_2$.
2. If v is a value of type $\{l_i = T_i^{i \in 1 \dots n}\}$ then $v = \{l_i = v_i^{i \in 1 \dots n}\}$, and $\Gamma \vdash v_i : T_i \ i \in 1 \dots n$.

Proof : Straightforward.

THEOREM [Progress]: Suppose t is a closed, well-typed term (that is, $\vdash t' : T$ for some T). Then either t is a value or else there is some t' with $t \longrightarrow t'$. Proof: Straightforward induction on typing derivations.

1. The variable case cannot occur (because t is closed).
2. The abstraction case is immediate, since abstractions are values.
3. For application, where $t = t_1 t_2$, with $\vdash t_1 : T_{11} \rightarrow T_{12}$ and $\vdash t_2 : T_{11}$, for the inversion lemma. Then, by the induction hypothesis, either t_1 is a value or else it can make a step of evaluation, and likewise t_2 . If t_1 can take a step, then rule *EApp1* applies to t . If t_1 is a value and t_2 can take a step, then rule *EApp2* applies. Finally, if both t_1 and t_2 are values, then the canonical forms lemma tells us that t_1 has the form $\lambda x : T_{11}.t_{12}$, and so rule *EAppAbs* applies to t .
4. If $t = (\text{let } x = t_1 \text{ in } t_2)$, then $\vdash t_1 : T_1$ and $\vdash t_2 : T_2$, for the inversion lemma. Then, by the induction hypothesis, either t_1 is a value or else it can make a step of evaluation. If t_1 can take a step, then rule *ELet* applies to t . If t_1 is a value, then rule *ELetV* applies.
5. If $t = \{l_i = t_i^{i \in 1 \dots n}\}$, then there are some types $T_i^{i \in 1 \dots n}$ such that for each i is satisfied that $\Gamma \vdash t_i : T_i$ and $T = \{l_i = T_i^{i \in 1 \dots n}\}$. By the induction hypothesis, for each $t_i^{i \in 1 \dots n}$, either it is a value or else it can make a step of evaluation. If all the $t_i^{i \in 1 \dots n}$ are values, then t is a value. If all the $t_i^{i \in 1 \dots n}$ are not values, then there is t_j such that it can take a step, then rule *ERcd* applies to t .

6. If $t = t'.l_j$, then there is some type $\{l_i = T_i^{i \in 1 \dots n}\}$ such that $\Gamma \vdash t' : \{l_i = T_i^{i \in 1 \dots n}\}$ and $T = T_j$. By the induction hypothesis, either t' is a value or else it can make a step of evaluation. If t' can take a step, then rule $EProj$ applies to t . If t' is a value, then rule $EProjRcd$ applies.
7. If $t = \text{fix } t'$, then $\Gamma \vdash t' : T \rightarrow T$, for the inversion lemma. By the induction hypothesis, either t' is a value or else it can make a step of evaluation. If t' can take a step, then rule $EFix$ applies to t . If t' is a value, then the canonical forms lemma tells us that t' has the form $\lambda x : T.t_1$, and so rule $EFixBeta$ applies to t .

LEMMA[Permutation]: If $\Gamma \vdash t : T$ and Δ is a permutation of Γ , then $\Delta \vdash t : T$.

Proof: Straightforward induction on typing derivations.

LEMMA[Weakening]: If $\Gamma \vdash t : T$ and $x \notin \text{dom}(\Gamma)$, then $\Gamma, x : S \vdash t : T$.

Proof: Straightforward induction on typing derivations.

LEMMA [Preservation of types under substitution]: If $\Gamma, x : S \vdash t : T$ and $\Gamma \vdash s : S$, then $\Gamma \vdash [x \mapsto s]t : T$.

Proof: By induction on a derivation of the statement $\Gamma, x : S \vdash t : T$. For a given derivation, we proceed by cases on the final typing rule used in the proof.

1. *Case TVar*: $t = z$ with $z : T \in (\Gamma, x : S)$. There are two sub-cases to consider, depending on whether z is x or another variable. If $z = x$, then $[x \mapsto s]z = s$. The required result is then $\Gamma \vdash s : S$, which is among the assumptions of the lemma. Otherwise, $[x \mapsto s]z = z$, and the desired result is immediate.
2. *Case TAbs*: $t = \lambda y : T_2.t_1$, with $T = T_2 \rightarrow T_1$ and $\Gamma, x : S, y : T_2 \vdash t_1 : T_1$. By convention, we may assume $x \neq y$ and $y \notin FV(s)$. Using permutation on the given subderivation, we obtain $\Gamma, y : T_2, x : S \vdash t_1 : T_1$. Using weakening on the other given derivation ($\Gamma \vdash s : S$), we obtain $\Gamma, y : T_2 \vdash s : S$. Now, by the induction hypothesis, $\Gamma, y : T_2 \vdash [x \mapsto s]t_1 : T_1$. By $TAbs$, $\Gamma \vdash \lambda y : T_2.[x \mapsto s]t_1 : T_2 \rightarrow T_1$. But this is precisely the needed result, since, by the definition of substitution, $[x \mapsto s]t = \lambda y : T_2.[x \mapsto s]t_1$.
3. *Case TApp*: $t = t_1 t_2$, $\Gamma, x : S \vdash t_1 : T_2 \rightarrow T_1$, $\Gamma, x : S \vdash t_2 : T_2$, $T = T_1$. By the induction hypothesis, $\Gamma \vdash [x \mapsto s]t_1 : T_2 \rightarrow T_1$ and $\Gamma \vdash [x \mapsto s]t_2 : T_2$. By $TApp$, $\Gamma \vdash [x \mapsto s]t_1 [x \mapsto s]t_2 : T$, then $\Gamma \vdash [x \mapsto s](t_1 t_2) : T$.
4. *Case TRcd*: $t = \{l_i = t_i^{i \in 1 \dots n}\}$, for each i , $\Gamma, x : S \vdash t_i : T_i$, $T = \{l_i = T_i^{i \in 1 \dots n}\}$. By the induction hypothesis, for each i , $\Gamma \vdash [x \mapsto s]t_i : T_i$. By the $TRcd$, $\Gamma \vdash \{l_i = [x \mapsto s]t_i^{i \in 1 \dots n}\} : T$, then $\Gamma \vdash [x \mapsto s]\{l_i = t_i^{i \in 1 \dots n}\} : T$.
5. *Case TLet*: $t = (\text{let } y = t_1 \text{ in } t_2)$, $\Gamma, x : S \vdash t_1 : T_1$, $\Gamma, x : S, y : T_1 \vdash t_2 : T_2$, $T = T_2$. By convention, we may assume $x \neq y$ and $y \notin FV(s)$. Using permutation on the given subderivation, we obtain $\Gamma, y : T_1, x : S \vdash t_2 : T_2$. Using weakening on the other given derivation ($\Gamma \vdash s : S$), we obtain $\Gamma, y : T_1 \vdash s : S$. Now, by the induction hypothesis, $\Gamma, y : T_1 \vdash [x \mapsto s]t_2 : T_2$ and $\Gamma \vdash [x \mapsto s]t_1 : T_1$. By $TLet$, $\Gamma \vdash \text{let } y : [x \mapsto s]t_1 \text{ in } [x \mapsto s]t_2 : T_2$. But this is precisely the needed result, since, $[x \mapsto s]t = (\text{let } y = [x \mapsto s]t_1 \text{ in } [x \mapsto s]t_2)$.

6. *Case TProj*: $t = t_1.l_j$, $\Gamma, x : S \vdash t_1 : \{l_i = T_i^{i \in 1 \dots n}\}$ and $T = T_j$. By the induction hypothesis, $\Gamma \vdash [x \mapsto s]t_1 : \{l_i = T_i^{i \in 1 \dots n}\}$. By *TProj*, $\Gamma \vdash [x \mapsto s]t_1.l_j : T$. But this is precisely the needed result, since, $[x \mapsto s]t = [x \mapsto s]t_1.l_j$.
7. *Case TFix*: $t = \text{fix } t_1$ and $\Gamma, x : S \vdash t_1 : T \rightarrow T$. By the induction hypothesis, $\Gamma \vdash [x \mapsto s]t_1 : T \rightarrow T$. By *TFix*, $\Gamma \vdash \text{fix } [x \mapsto s]t_1 : T$. But this is precisely the needed result, since, $[x \mapsto s]t = \text{fix } [x \mapsto s]t_1$.

LEMMA[Preservation]: If $\Gamma \vdash t : T$ and $t \longrightarrow t'$, then $\Gamma \vdash t' : T$.

Proof: By induction on a derivation of $t : T$. At each step of the induction, we assume that the desired property holds for all subderivations (i.e., that if $s : S$ and $s \longrightarrow s'$, then $s' : S$, whenever $s : S$ is proved by a subderivation of the present one) and proceed by case analysis on the final rule in the derivation.

1. *Case TVar*: It cannot be the case that $t \longrightarrow t'$ for any t' , and the requirements of the theorem are vacuously satisfied.
2. *Case TAbs*: $t = \lambda x : T_2.t_1$, with $T = T_2 \rightarrow T_1$ and $\Gamma, x : T_2 \vdash t_1 : T_1$. If the last rule in the derivation is *TAbs*, then we know from the form of this rule that t must be a function $\lambda x : T_2.t_1$ and T must be $T_2 \rightarrow T_1$, with $\Gamma, x : T_2 \vdash t_1 : T_1$. But then t is a value, so it cannot be the case that $t \longrightarrow t'$ for any t' , and the requirements of the theorem are vacuously satisfied.
3. *Case TApp*: $t = t_1 t_2$, $\vdash t_1 : T_2 \rightarrow T$ and $\vdash t_2 : T_2$. If the last rule in the derivation is *TApp*, then we know from the form of this rule that t must have the form $t_1 t_2$, for some t_1 and t_2 . We must also have a subderivation with conclusions $\vdash t_1 : T_2 \rightarrow T$ and $\vdash t_2 : T_2$. Now, looking at the evaluation rules with this form on the left-hand side, we find that there are three rules by which $t \longrightarrow t'$ can be derived: *EApp1*, *EApp2* and *EAppAbs*. We consider each case separately.
 - *Subcase EApp1*: $t_1 \longrightarrow t'_1$, $t' = t'_1 t_2$. By the induction hypothesis, $\vdash t'_1 : T_2 \rightarrow T$, then we can apply rule *TApp*, to conclude that $\vdash t'_1 t_2 : T$, that is $\vdash t' : T$.
 - *Subcase EApp2*: $t_2 \longrightarrow t'_2$, $t' = t_1 t'_2$. By the induction hypothesis, $\vdash t'_2 : T_2$, then we can apply rule *TApp*, to conclude that $\vdash t_1 t'_2 : T$, that is $\vdash t' : T$.
 - *Subcase EAppAbs*: $t_1 = \lambda x : T_1.t_{12}$, $t_2 = v_2$, $t' = [x \mapsto v_2]t_{12}$ and $\vdash t_{12} : T$ for the inversion lemma. The resulting term $\vdash [x \mapsto v_2]t_{12} : T$, for the Substitution lemma, that is $\vdash t' : T$.
4. *Case TRcd*: $t = \{l_i = t_i^{i \in 1 \dots n}\}$, for each i , $\vdash t_i : T_i$, $T = \{l_i = T_i^{i \in 1 \dots n}\}$.
 - If for each i , $t_i = v_i$, then t is a value, so it cannot be the case that $t \longrightarrow t'$ for any t' , and the requirements of the theorem are vacuously satisfied.
 - *Subcase ERcd*: $t = \{l_i = v_i^{i \in 1 \dots j-1}, l_j = t_j, l_k = t_k^{k \in j+1 \dots n}\}$, $t_j \longrightarrow t'_j$, $t' = \{l_i = v_i^{i \in 1 \dots j-1}, l_j = t'_j, l_k = t_k^{k \in j+1 \dots n}\}$ and $\vdash t_j : T_j$. By the induction hypothesis, $\vdash t'_j : T_j$, then we can apply rule *TRcd*, to conclude that $\vdash t' : T$.
5. *Case TLet*: $t = (\text{let } x = t_1 \text{ in } t_2)$, $\Gamma \vdash t_1 : T_1$ and $\Gamma, x : T_1 \vdash t_2 : T$. If the last rule in the derivation is *TLet*, then we know from the form of this rule that t must have the form

(*let* $x = t_1$ *in* t_2), for some t_1 and t_2 . We must also have a subderivation with conclusions $\vdash t_1 : T_1$ and $\vdash t_2 : T_2$. Now, looking at the evaluation rules with *Let* form on the left-hand side, we find that there are two rules by which $t \longrightarrow t'$ can be derived: *ELetV* and *ELet*. We consider each case separately.

- *Subcase ELetV*: $t_1 = v_1$, $t' = [x \mapsto v_1]t_2$, and $\vdash t_2 : T$. Then for the substitution lemma $t' : T$.
 - *Subcase ELet*: $t_1 \longrightarrow t'_1$ and $t' = (\text{let } x = t'_1 \text{ in } t_2)$. By the induction hypothesis, $\vdash t'_1 : T_1$, then we can apply rule *TLet*, to conclude that $\vdash (\text{let } x = t'_1 \text{ in } t_2) : T$, that is $\vdash t' : T$.
6. *Case TProj*: $t = t_1.l_j$, $\vdash t_1 : \{l_i = T_i^{i \in 1 \dots n}\}$ and $T = T_j$. If the last rule in the derivation is *TProj*, then we know from the form of this rule that t must have the form $t_1.l_j$. We must also have a subderivation with conclusions $\vdash t_1 : \{l_i = T_i^{i \in 1 \dots n}\}$ and $T = T_j$. Now, looking at the evaluation rules with this form on the left-hand side, we find that there are two rules by which $t \longrightarrow t'$ can be derived: *EProjRcd* and *EProj*. We consider each case separately.
- *Subcase EProjRcd*: $t_1 = \{l_i = v_i^{i \in 1 \dots n}\}$ and $t' = v_j$. This means we are finished, since we know $\vdash v_j : T_j$ and $T = T_j$.
 - *Subcase EProj*: $t_1 \longrightarrow t'_1$ and $t' = t'_1.t_j$. By the induction hypothesis, $\vdash t'_1 : \{l_i = T_i^{i \in 1 \dots n}\}$, then we can apply rule *TLet*, to conclude that $\vdash t'_1.t_j : T_j$, that is $\vdash t' : T$.
7. *Case TFix*: $t = \text{fix } t_1$ and $\vdash t_1 : T \rightarrow T$. If the last rule in the derivation is *TFix*, then we know from the form of this rule that t must have the form $\text{fix } t_1$, for some t_1 . We must also have a subderivation with conclusions $\vdash t_1 : T \rightarrow T$. Now, looking at the evaluation rules with *fix* on the left-hand side, we find that there are two rules by which $t \longrightarrow t'$ can be derived: *EFixBeta* and *EFix*. We consider each case separately.
- *Subcase EFixBeta*: $t_1 = \lambda x : T_1.t_2$, $t' = [x \mapsto (\text{fix } (\lambda x : T_1.t_2))]t_2$, $\vdash t_1 : T \rightarrow T$ and $\vdash t_2 : T$, for the inversion lemma. Then, by the substitution lemma, $\vdash [x \mapsto (\text{fix } (\lambda x : T_1.t_2))]t_2 : T$, which is what we need.
 - *Subcase EFix*: $t_1 \longrightarrow t'_1$ and $t' = \text{fix } t'_1$. By the induction hypothesis, $\vdash t'_1 : T \rightarrow T$, then we can apply rule *TFix*, to conclude that $\vdash \text{fix } t'_1 : T$, that is $\vdash t' : T$.
